Abstract: The present study was undertaken to find out the concentration of micro-nutrients in the leaves of pear cultivar "Bartlett" grown in Kashmir, which revealed that concentration of zinc and manganese were adequate to high, whereas copper content was low to adequate. The concentration of Iron was found adequate in all the samples of pear orchards. The relationship among the micro-nutrient cations in the foliage of pear was significantly positive. The micro-nutrients varied significantly among the pear orchards of three altitudes during the course of study.
